                                                                                                                                                                                                                                                                                                                                                         AAB08273 standard; Protein; 160 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a formulation comprising Apo-2 ligand and divalent metal ions. Apo-2 ligand and the formulation of the treating cancers and viral infections. Addition of divalent metal ions for making Apo-2 ligand and formulations containing Apo-2 ligand results in increased yield and stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAHO8265-83 represent tumour necrosis factor (TNF) ligands. The specification describes an AGP-3 polypeptide, which is TNF ligand specification describes an AGP-3 polypeptide, which is TNF ligand factor family member. AGP-3 is a type II transmembrane protein, and is a increase in the number of B cells and immunoglobulins produced. AGP-3 proteins, antibodies, and nucleic acids may be used to treat AGP-3 proteins, antibodies, and nucleic acids may be used to replace, e.g. rheumatoid arthritis, inflammatory and immune disorders, e.g. rheumatoid arthritis, crohn's disease, lupus and graft versus host disease. The nucleic crohn's disease, lupus and graft versus host disease. The called acids may be used to replate the expression of a AGP-3 related acids may be used to replate the expression of an AGP-3 related useful for the detection of AGP-3 agonists, antagonists and useful for the detections with AGP-3 related proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 14; Fig 9; 71pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptides and the polynucleotide sequences encoding them. The propertides, agonists, antagonists or anti-pRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. AAU86128-AAU86162 represent the human PRO polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Watanabe CK, Wood WI;

The method of the invention involves administering to the mammal a tumour necrosis factor-related activation induced cycokine (TRANCE)-modulating agent. The method is useful for treating a mammal CC having a disorder comprising insufficient or excessive cartilage or CC skeletal growth, where the disorder comprising insufficient cartilage or CC craniofacial-skeletal discrepancies and bone or cartilage artilage or CC craniofacial-skeletal discrepancies and bone or cartilage damage CC growth are selected from acromegaly, surgery, osteoarthritis or rheumatic of the selected from acromegaly, glgantism, exostosis, cartilagines, cartilagines and bursata and multiple osteocartilaginous exostoses. The method CC exostosis bursata and multiple osteocartilaginous exostoses. The method CC acid sequence represents the human TRANCE protein, splice variant 2, of the invention. TRANCE is a member of the tumour necrosis factor family

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    detection of OPG binding protein) and to identify compounds that modulate binding of OPG binding protein to osteoclast differentiation modulate binding of OPG binding protein con sociocast differentiation and activation receptor (ODAR). The nucleic acid molecule encoding OPG binding protein can be used to detect OPG binding protein-encoding binding protein can be used to detect OPG binding protein encoding transgenic animal models, while complementary sequences are used for transgenic animal models, while complementary sequences are used for antisense regulation of OPG binding protein expression. Modulators of OPG binding protein, particularly soluble forms of OPG binding protein or activation of OPG binding protein. Soluble forms of OPG binding protein particularly soluble forms of OPG binding protein or b, are used to treat or prevent bone diseases, e.g. osteoporosis, bone loss caused by arthritis or metastases, hypercalcaemia, Paget's disease, periodontal disease, osteoporosis, loosening of prostheses, optionally in combination with agents that promote bone growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

           The present sequence represents an osteoclastogenesis inhibitory factor (OCIF)-binding molecule (OBM). The protein promotes and supports the separation and maturation of osteoclasts in the presence of bone absorption factors such as calcitriol or parathyroid hormone (PTH). OBM is isolated from stroma cells cultured in the presence of a bone OBM is isolated from stroma cells cultured in the presence of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
This represents a human RANKL, a ligand for the RANK (receptor CC activator of necrosis factor (RappaB (NF-kB)) polypeptide. RANK is a CC activator of necrosis factor (RMP) family. A soluble RANK CC member of the tumour necrosis factor (RMP) family. A soluble RANK CC member of the fumour necrosis factor (RMP) family. A soluble RANK CC may be used for inhibiting activated not of NF-kB, by contacting a cell cc expressing membrane-associated RANK with a soluble RANK and can be CC used to induce maturation of dendritic cells and enhance their CC used to induce maturation of dendritic cells and enhance their CC used to induce maturation of the cells and enhance their CC composition may also be used for regulating an immune or inflammatory response. Inhibition of NF-kB by RANK antagonists immune or inflammatory response. Inhibition of NF-kB by RANK antagonists immune or inflammatory response. Inhibition of NF-kB by RANK antagonists immune or sepsis, graft-versus-host reactions, or acute inflammatory cc reactions. They can also be used in adjunct therapy for disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             then affinity chromatography using OCIF. It exists in a full-sequence form and a solubilised form (sOBM) which is a shorter chain. OBM may be form screening potential inhibitors and modifiers of its biological used for screening for receptors to OBM which mediate its function. activity, and screening for receptors to OBM which mediate its function. These substances can then be used in the treatment of disorders of bone function and calcium metabolism. The antibodies can be used for assay function and calcium metabolism. The antibodies can be used for assay function and calcium metabolism. The antibodies can be used for assay function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                components of drugs.

This represents a human RANKL, a ligand for the RANK (receptor activator of necrosis factor kappaB (NF-kB)) polypeptide. RANK is a CC member of the tumour necrosis factor (TNF) family. Host cells transformed to runsfected with an expression vector comprising the RANK encoding CC nucleic acid can be used to produce recombinant RANK protein. The soluble RANK may be used for inhibiting activation of NF-kB, by contacting a cell CC expressing membrane-associated RANK with a soluble RANK which binds to CC used for regulating an immune or inflammatory response. Inhibition of CC NF-kB by RANK antagonists may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in inflammatory reactions. They can also be used in adjunct therapy for consists can also be used in adjunct therapy for can also be used for detection and drum account.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             G

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                characterised by neoplastic cells that express RANK. RANKL polypeptides can also be used to identify inhibitors of RANK and thus inhibitors of an inflammatory response, and also for protecting RANK-expressing cells from the negative effects of chemotherapy or the presence of high levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of TNF-alpha. The products can also be used for detection and drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             179 SHKVSLSSWYHDRGWAKISNWTFSNGKLIVNQDGFYYLYANICFRHHETSGDLATEYLQL 238

                The present sequence represents a human osteoprotegerin ligand (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoplastogenesis in a dose dependent protein. The OPGL protein is synthesised as a type II transmembrane is a potent osteoplast differentiation factor when combined with CSF-1. Of CSF-1. OPGL is also an activator of mature osteoplast differentiation factor when combined with CSF-1. of CSF-1. OPGL is also an activator of mature osteoplasts. The opgl activaty in an animal. The method comprises using at least one OPGL activaty in an animal. The method comprises using at least one OPGL an immune response in the animal. The method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other alicenses.
         diseases or conditions characterised by excessive bone resorption
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
Ax The patent discloses novel receptor activator of nuclear factor (NF)-
CC kappaB (RANK) proteins and their corresponding DNAS. RANK is a member
CC with TNF receptor associated factor (TNF) receptor superfamily and associates
CC with TNF receptor associated factor (TNF) and 3 which are important
CC in the regulation of immune and inflammatory response. The receptors
CC are useful for regulating immune response and in screening for inhibitors
CC of these receptors. The cytoplasmic domain of RANK is used in developing
CC of these receptors of signal transduction, e.g. for screening the
CC molecules that inhibit interaction of RANK with TRAF1, TRAF2, TRAF3,
CC molecules that inhibit interaction of RANK with TRAF1, TRAF2, TRAF3,
CC response that result from triggering of RANK, e.g. in treating toxic
CC are useful in ameliorating the negative effects of an inflammatory
CC shock or sepsis, graft-versus-host reactions, acute inflammatory
CC shock or sepsis, graft-versus-host reactions, acute inflammatory
CC apoptotic signal and rescue the cells that express RANK from apoptosis.
CC soluble forms of the receptor are used in vivo or in vitro based
CC soluble forms of the receptor are used in vivo or to inhibit
CC antagonists of RANK-mediated NF-kappa B activation, or to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; receptor activator of nuclear factor kappaB ligand; RANKL; NF; tumour necrosis factor; TNF; TNF receptor associated factor; TRAP; tumour necrosis finflammatory response; graft-versus-host reaction; immune response; inflammatory response; profit bone resorption; toxic shock; sepsis; acute inflammatory reaction; bone resorption; anti-apoptotic signal; therapy; immunosuppressant; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAE08738 standard; Protein; 317 AA.

RANK compositions are used in the development of both agonistic and antagonistic antibodies, or as an adjunct therapy for disease characterised by neoplastic cells that express RANK. Compounds that interfere with RANK/TRAF6 interactions are useful for modulating the formation of osteoclasts from osteoclast express and for modulating osteoclast function and activities. They are used as inhibitors of diseases associated with excess bone resorption and as immunosuppressants or anti-inflammatory agents. The RANK DNAs are used as inhibitors of anti-inflammatory agents. The ranalysis useful for the expression of recombinant proteins, as probes for analysis useful in preparing kits for the detection of soluble RANK, or are useful in preparing kits for the detection of soluble RANK, or are useful in preparing kits for the detection of soluble RANK ligand monitor RANK related activity. The present sequence is RANK ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (RANKL) protein from human.

                                                                                                                                                                                                                                                                                                 (IMMV ) IMMUNEX CORP.
                                                                                                                                       New DNA molecules, useful for producing ligands (which are useful for regulating immune response and in screening for inhibitors of NF-chi B receptor activator) of the receptor activator of NF-chi B (RANK)
The present invention relates to receptor activator of NF-chi B (RANK) to DNA. RANK is mapped to chromosome 18q22.1 and its ligand (RANKL) to Chromosome 13q14. RANK and RANKL are type 1 and type 2 transmembrane proteins respectively. RANK is a member of the tumour necrosis factor (TNF) superfamily and it closely resembles CD40 in the extracellular

The present invention relates to a novel receptor, referred to as RANK (receptor activator of NF (nuclear factor). KappaB), a member of TNF (tumour necrosis factor) receptor superfamily. RANK is a Type I factors (TRAFS). Triggering of RANK by overexpression or co-expression of factors (TRAFS). Triggering of RANK by overexpression or co-expression or co-expressi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 14

The DNA molecules are useful for producing ligands of RANK. The ligands are useful for regulating immune response and in screening for inhibitors of RANK. The present sequence is human RANKL (huRANKL)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

CC from infection with a pathogenic or opportunistic organism. The method convolves administering a combination of two to five agents comprising:

CC (a) dendritic cell mobilisation factor; (b) dendritic cell maturation of two to five agents comprising:

CC agent; (c) dendritic cell activation agent; (d) Tocal antauration:

CC or (e) activated, antigen-specific Tocals. The methods are useful for treating an individual at risk for or suffering from infection with a composition or opportunistic organism, e.g. vituses (e.g. HIV), bacteria cruzi, which causes Chaga's disease). The methods are especially companied a lymphocyte-mediated immune response. In particular, the harpes, mononucleosis, multifocal leukoencephalopathy, hepatitis, AIDS, cepresents a human RANKL polypeptide fragment. The present sequence xx

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           are produced by alternative splicing.

TISSUE SPECIFICITY: HIGHEST IN THE PERIPHERAL LYMPH NODES BUT
WEAK IN SPLEEN, PERIPHERAL BLOOD LEUKCCYTES, BONE MARROW, HEART,
PLACENTA, SKELETAL MUSCLE, STOMACH AND THYROID.

INDUCTION: UPREGULATED BY T CELL RECEPTOR STIMULATION.

PTM: The soluble form of isoform 1 derives from the membrane for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hypercalcenia of malignancy.
SUBUNT: Homotrimer (By similarity).
SUBCELLULAR LOCATION: Type II membrane protein (isoforms 1 and 3);
Secreted (isoform 2). A soluble form of isoform 1 arises by
Proteolytic processing (By similarity).
ALTERNATIVE PRODUCTS: 3 isoforms; 1 (shown here), 2/SODF and 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                by proteolytic processing (By similarity). Osteoclast differentiation and activation factor. Augments the ability of dendritic cells to stimulate naive T-cell proliferation. May be an important regulator of interactions between T cells and dendritic cells and may play a role in the regulation of the T cell-dependent immune response. May also play an important role in enhanced bone-resorption in humoral
                                                                                                                                                                                                                                                                                                                                                                                                        HGNC:11926; TNFSF11.

"Evidence that the rat osteopetrotic mutation toothless (tl) is not in the TNFSF11 (TRANCE, RANKL, ODF, OPGL) gene.",

Int. J. Dev. Bol. 45:853-859(2001).

-!- FUNCTION: Cytokine that binds to TNFRSF11B/OPG and to Augments the ability of dendritic cells to stimulate naive T-cell proliferation. May be an important regulator of interactions regulation of the T cells and dendritic cells and may play a role in the regulation of the T cell-dependent immune response. May also play
                                                                                                                              PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

-!- SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY.

-!- FISSUE SPECIFICITY: HIGHLY EXPRESSED IN THYMUS AND LYMPH NODES BUT NOT IN NONLYMPHOID TISSUES AND IS ABUNDANTLY EXPRESSED IN T CELLS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 by proteolytic processing. The cleavage may be catalyzed by ADAMI?. A further shorter soluble form was observed.
DISEASE: DEFICIENCY IN THESTII RESULTS IN FAILURE TO FORM LOBULO-
ALVEOLAR MAMMARY STRUCTURES DURING PRECNANCY RESULTING IN DEATH
OF NEWBORNS. TRANCE-DEFICIENT MICE SHOW SEVERE OSTEOPETROSIS, WITH NO OSTEOCLASTS, MARROW SPACES, OR TOOTH EROPTION, AND EXHIBIT THE LIMBS, SKULL, AND VERTEBRAE AND HAVE MELETAL SITES, INCLUDING HYPERTROPHIC CHONDROCYTES.

WITH THICK, IRREGULAR GROWTH PLATES AND A RELATIVE INCREASE IN SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TRABECULAR BONE AND LUNG.

Velikodvorskaja G.A.;

"Cloning the Clostridium thermocellum thermostable laminarinase gene in Escherichia coli; the properties of the enzyme thus produced.";

In Escherichia coli; the properties of the enzyme thus produced.";

In Escherichia Crivity: Hydrolysis of 1,4-beta-D-glycosidic linkages in beta-D-glucans containing 1,3- and 1,4-bonds.

In Subunii: May form Part of A MILIENZYME COMPLEX (CELLULOSOME).

WELL AS IN OTHER C.THERMOCELLUM CELLULOSOME ENZYMES. THIS ENZYME AS ANY FUNCTION AS THE BINDING LIGAND FOR THE SL COMPONENT.

II SIMILARITY: BELONGS TO FAMILY 16 OF GLYCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL; X63355; CAA44959.1; -. Immunol. Immunopathol. 67:359-372(1999).

FUNCTION: PRODUCED BY ACTIVATED MACROPHAGES, IL-1 STIMULATES THYMOCYTE PROLIFERATION BY INDUCING IL-2 RELEASE, B-CELL MATURATION & PROLIFERATION, & FIBROBLAST GROWTH FACTOR ACTIVITY. IL-1 PROTEINS ARE INVOLVED IN THE INFLAMMATORY RESPONSE, BEING IDENTIFIED AS ENDOGENOUS PYROGENS, AND ARE REPORTED TO STIMULATE THE RELEASE OF PROSTAGLANDIN AND COLLAGENASE FROM SYNOVIAL CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PRECURSOR SEQUENCE SUGGESTS THAT IL-1 IS RELEASED BY DAMAGED CELLS OR IS SECRETED BY A MECHANISM DIFFERING FROM THAT USED FOR OTHER SECRETORY PROTEINS.

Sequence 13, Application US/09577780 Patent No. 6419929 GENERAL INFORMATION:

APPLICANT: Anderson, Dirk M.

Galibert, Laurent Maraskovsky, Eugene

CORRESPONDENCE ADDRESS:

CITY: Seattle STATE: WA COUNTRY: USA

ADDRESSEE: Immunex Corporation, Law Department STREET: 51 University Street

TITLE OF INVENTION: Ligand for Receptor Activator of NF-kappaB NUMBER OF SEQUENCES: 19

PRILING APPLICATION WARA.

APPLICATION UNMBER: 08/995,659

FILING DATE: <Unknown>
APPLICATION NUMBER: USSN 08/813,509

FILING DATE: <10 MARCH 1997

FILING DATE: 07 WARCH 1997

APPLICATION NUMBER: USSN 08/772,330

FILING DATE: 23 DECEMBER 1996

FILING DATE: 23 DECEMBER 1996

ATTORNEY/AGENT INFORMATION:

NAME: PEIKINS, PAILICIA ANDE
REGISTRATION NUMBER: 34,693

REFERENCE/DOCKET NUMBER: 2852-A

TELECOMMUNICATION INFORMATION:

TELEPHONE: (206)587-0430

TELEPEAX: (206)233-0644

INFORMATION FOR SEQ ID NO: 13:
SEQUENCE CHARACTERISTICS:

SEQUENCE CHARACTERISTICS:

LENGTH: 317 amino acids

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: Apple Power Macintosh
COMPUTER: Apple Power Macintosh
OPERATING SYSTEM: Apple Operating System 7.5.5
OPERATING SYSTEM: Apple Operating System 7.5.5
CURRENT APPLICATION DATA:

CURRENT APPLICATION NUMBER: US/09/577,780

APPLICATION NUMBER: US/09/577,780

FILING DATE: 24-May-2000
CLASSIFICATION: <UNKNOWN>

                                                                                                                                                                                                                                                     pred. No. is the number of results predicted by chance to have a pred. No. is the number of the score of the result being printed, score greater than or equal to the total score distribution. and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-09-880-457-4

                                                                                                                                                                                                                                                                                                                                                                                                                                     CC encoding PRO polypeptides. The sequences of the 122 PRO polynched acids composed human secreted proteins. The sequences of the 122 PRO polynched composed and secreted proteins. The PRO nucleic acids composed antagonists are useful for diagnosing tumours, colon cancer, breast impour, proteins and antagonists are useful for treating a PRO polypeptides of the PRO polypeptides are useful for diagnosing tumours, respecially lung compositions of the PRO polypeptides. The PRO polypeptides is the proliferation of or gene expression, in prostate tumour, rectal tumour or stimulating the release of tumour prostate tumour, rectal tumour or fibroblast cells. The proliferantiation of normal ating the release of tumour necrosis factor alpha from human or stimulating composed and for the proliferation of normal human blood, and in chromosome and gene mapping. The PRO be used as molecular sequences of the invention. ANU83592-AAU83713 represent human probes, and the properties of the invention of the proliferation of the problem and the problem is a sequence of the invention.
                                                                                                              Mouse FLAG-murine OPGbp[158-316].
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                17-DEC-2001

                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a formulation comprising Apo-2 ligand and divalent metal ions. Apo-2 ligand and the formulation are useful for treating cancers and viral infections. Addition of divalent metal ions for making Apo-2 ligand and formulations containing Apo-2 ligand results in increased yield and stability of Apo-2 ligand trimers.

AAB08265-83 represent tumour necrosis factor (TNF) ligands. The specification describes an AGP-3 pypeptide, which is TNF ligand family member. AGP-3 is a type II transmembrane protein, and is a potent B cell stimulatory factor. Expression of AGP-3 correlates to increases in the number of B cells and immunoglobulins produced. AGP-3 proteins, antibodies, and nucleic acids may be used to treat inflammatory and immune disorders, e.g. rheumatoid arthritis, Crohn's disease, lupus and graft versus host disease. The nucleic acids may be used to regulate the expression of an AGP-3 related protein. The AGP-3 proteins, antibodies and nucleic ands are also useful for the detection of AGP-3 agonists, antagonists and characterizing interactions with AGP-3 related proteins.
Human; PRO; benign tumour; malignant tumour; lymphoid malignancy; leukaemia; neuronal disorder; stromal disorder; blastocoelic disorder; inflammatory disorder; immune disorder; angiogenic disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                   polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular macrophagal, stromal and blastocoelic disorders, inflammatory, immune and anglogenic disorders. The polynucleotide sequences are also useful in gene therapy. AAU86128-AAU86162 represent the human PRO

resulting from traumatic injury, surgery, osteoarthritis or rheumatoid arthritis, and disorders comprising excessive cartilage or skeletal growth are selected from acromegaly, gigantism, exostosis, carilaginea, exostosis bursata and multiple osteocartilaginous exostoses. The method is useful for inhibiting chondrocyted differentiation. The present amino acid sequence represents the human TRANCE protein, splice variant 2 of the invention. TRANCE is a member of the tumour necrosis factor family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a new method of treating a mammal having a disorder comprising insufficient or excessive cartilage or skeletal growth. The method of the invention involves administering to the mammal a tumour necrosis factor-related activation induced cytokine (TRANCE)-modulating agent. The method is useful for treating a mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating mammal having disorder characterised by abnormal cartilage/skeletal growth such as dwarfism, acromegaly, by administering tumour necrosis factor-related activation induced cytokine-modulating agent to mammal
                                            Osteoclastogenesis inhibitory factor; OCIF; OCIF-binding molecule; OBM;
                                                                                                                                        Osteoclastogenesis inhibitory factor (OCIF)-binding molecule (OBM).
